## PMF Simulation Report

A four-player survival game where seasons reshape the map and alliances determine the ending.

|                   |                                                                             |
|-------------------|-----------------------------------------------------------------------------|
| FIT SIGNAL        | 81 / 100                                                                    |
| Research question | Can a social survival game retain both coordinated groups and solo players? |

### Signal overview

### Executive recommendation

Ship a public co-op demo centered on one seasonal transformation. Measure group return intent while testing catch-up, solo companions, and reduced midgame resource chores.

## Segment response

| SEGMENT               | SIGNAL             | WHAT WE HEARD                                                                       |
|-----------------------|--------------------|-------------------------------------------------------------------------------------|
| Co-op groups          | <b>Strong pull</b> | Persistent settlements and consequential seasonal choices create return motivation. |
| Creators              | <b>Strong pull</b> | Map transformations and alliance outcomes produce compelling public moments.        |
| Solo and time-limited | <b>At risk</b>     | Catch-up, no-voice matchmaking, and reduced grind determine accessibility.          |

## Leading objections

1. Seasonal progress may punish time-limited players
2. Solo and no-voice matchmaking need first-class support
3. Resource grind could overwhelm the social differentiation

## Representative thoughts

*"A shared settlement that remembers our choices gives the group a reason to return."*

*"I cannot lose a whole season because I missed two evenings."*

*"I would wishlist after a demo that proves the social systems create stories, not just grind."*

## Recommended validation plan

Ship a public co-op demo centered on one seasonal transformation. Measure group return intent while testing catch-up, solo companions, and reduced midgame resource chores.

## Next study

Run a focused concept test with real target users. Preserve the same segment definitions, test the leading objections directly, and compare observed behavior against stated pilot or purchase intent.

## Methodology and limitations

This report is generated from a hardcoded frontend demonstration containing nine curated personas and a deterministic thought timeline. It demonstrates the intended Snorkel product flow and report structure. It is not primary market research, a statistically representative survey, or evidence of actual customer demand.

Snorkel converts customer context into simulated reactions, comparable signals, and meeting-ready product decisions.
