

Orbit Note

PMF Simulation Report

An AI meeting puck that turns room audio into decisions, owners, and follow-ups.

FIT SIGNAL	78 / 100
Research question	Will hybrid teams trust and pay for an always-on AI meeting device?

Signal overview

Executive recommendation

Pilot in three hybrid meeting rooms with raw-audio storage disabled. Gate expansion on action-item precision, consent comprehension, and administrator controls.

Segment response

SEGMENT	SIGNAL	WHAT WE HEARD
Product and operations	Strong pull	Decision logs and action handoffs solve a frequent coordination problem.
Employees	Conditional	Visible hardware helps, but consent and source-linked summaries are expected.
IT and security	Blocked	Retention, deletion, regional processing, SCIM, and audit logs are required.

Leading objections

- 1. Recording consent and visible privacy controls
- 2. Enterprise retention, deletion, and regional processing
- 3. Hardware cost compared with software meeting bots

Representative thoughts

- "The decision log is immediately useful. I spend Mondays reconstructing who promised what."*
- "Always-on audio creates a consent problem before it creates a productivity win."*
- "I would pilot this in three rooms if every claim links back to the moment it was said."*

Recommended validation plan

Pilot in three hybrid meeting rooms with raw-audio storage disabled. Gate expansion on action-item precision, consent comprehension, and administrator controls.

Next study

Run a focused concept test with real target users. Preserve the same segment definitions, test the leading objections directly, and compare observed behavior against stated pilot or purchase intent.

Methodology and limitations

This report is generated from a hardcoded frontend demonstration containing nine curated personas and a deterministic thought timeline. It demonstrates the intended Snorkel product flow and report structure. It is not primary market research, a statistically representative survey, or evidence of actual customer demand.

Snorkel converts customer context into simulated reactions, comparable signals, and meeting-ready product decisions.
